Hermes + Cognee AI Stack

This repository contains the scaffolded components and documentation for deploying a Hermes Agent + Cognee AI stack on DigitalOcean with secure public access via Cloudflare Tunnel, organized using the Interpreted Context Methodology (ICM).

Project Structure

```
/home/david/projects/hermes-stack/
├── README.md                    # This file
├── ICM_WORKFLOW.md             # Interpreted Context Methodology workflow
├── docker-compose.yml           # Cognee backend and MCP server
configuration
├── .env.template               # Environment variable template
└── cloudflared/
    └── config.yml              # Cloudflare Tunnel configuration template
```

Overview

This stack deploys:

- **Hermes Agent**: AI agent gateway running on localhost:3000
- **Cognee Backend**: Knowledge graph REST API on localhost:8000
- **Cognee MCP Server**: MCP memory layer for AI tools on localhost:8001
- **Cloudflare Tunnel**: Secure ingress for all services (outbound-only connections)

Usage

1. Copy `.env.template` to `.env` and configure your LLM API key
2. Update `cloudflared/config.yml` with your actual Tunnel ID and domain

3. Follow the ICM workflow in `ICM_WORKFLOW.md` to provision and deploy the stack
4. Use DigitalOcean MCP and GitHub MCP tools to automate infrastructure and repository operations

Security

- All service ports bound to localhost only (127.0.0.1:3000, 127.0.0.1:8000, 127.0.0.1:8001)
- No inbound firewall ports required except SSH (22)
- All traffic routed through Cloudflare Tunnel with automatic SSL
- Origin IP remains hidden

Components

Service	Port	Purpose
Hermes Agent	localhost:3000	AI agent gateway & web UI
Cognee Backend	localhost:8000	Knowledge graph REST API
Cognee MCP Server	localhost:8001	MCP memory layer for AI tools
Cloudflare Tunnel	outbound only	Secure public ingress for all services

Documentation

- Interpreted Context Methodology Workflow
- Original Hermes + Cloudflare Setup Guide: `hermes-cloudflare-setup.md`
- Extended Hermes + Cognee Stack Guide: `hermes-stack.md`

Requirements

- DigitalOcean account with API token
- Cloudflare account with active domain
- LLM API key (OpenRouter / Anthropic / OpenAI)

- Local SSH client
- DigitalOcean MCP server configured in your AI tool
- GitHub MCP server configured in your AI tool
